LECTURE 2 - CALCULUS

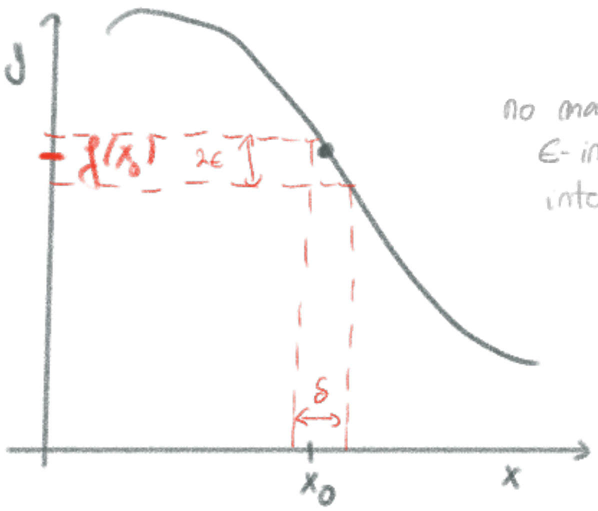
* recap - continuity
* limits (1.2 - 1.3)
* asymptotes (4.6)

I. Continuity

A function $f(x)$ is continuous at a point x_0 of it's domain if, for all points of the domain x,

$$\forall \epsilon > 0, \exists \delta > 0 : |x - x_0| < \delta \Rightarrow |f(x) - f(x_0)| < \epsilon$$

* this is a very technical definition, meaning that, as x approaches x_0, $f(x)$ approaches $f(x_0)$
* In practice, the function "does not jump", "we do not need to lift the pen"

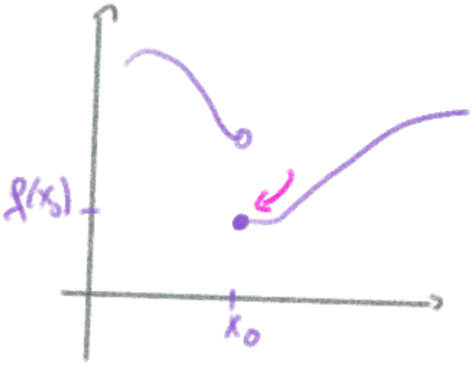


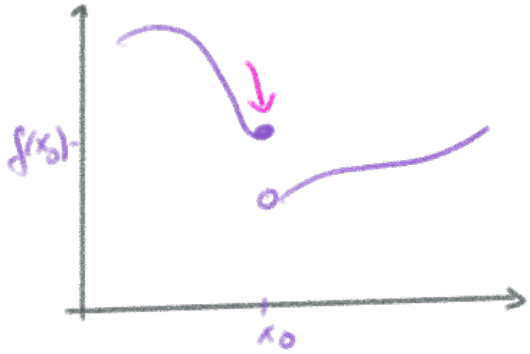
no matter how small we choose $\epsilon > 0$, the ϵ-interval around $f(x_0)$ is mapped onto an interval around x_0

* A function is continuous on it's domain if it is continuous on all points of its domain
* All typical functions (polynomials, sin/cos, exp/ln, $\sqrt{\ }$) are continuous on their domain.
* Sums, multiplications, ratios, .., composition of continuous functions are continuous.

↳ note : ON THEIR DOMAIN. For example $f(x) = \frac{1}{x}$ is UNDEFINED at $x = 0$ ($x = 0$ is not in the domain).
(this may differ in other text books)

* DISCOUTINUITIES





$f(x)$ is discontinuous / right continuous at x_0

$f(x)$ is discontinuous / left continuous at x_0

* left / right continuous : $f(x)$ approaches $f(x_0)$ when x approaches x_0 from the left/right

  continuous = left and right continuous

* a function is continuous on $[a,b]$ if it is continuous on (a,b), left continuous at b and right continuous at a.

* a function is piecewise continuous if it has a finite number of discontinuities.

II LIMITS

↳ how to describe a function towards the edges of it's domain?

$\lim\limits_{x \to 1} \frac{x-1}{x^2-1}$? $\quad \lim\limits_{x \to 0} x \ln(x^2)$? $\quad \lim\limits_{x \to 0} \frac{\sin(x)}{x}$?

* limits describe a function $\begin{cases} \text{AROUND} \\ \text{close to} \\ \text{as } x \text{ approaches} \end{cases}$ x_0

↳ typically useful if $f(x)$ is undefined / discontinuous at x_0

DEFINITION OF LIMIT : $\lim\limits_{x \to x_0} f(x) = L$ if for all points x in the domain of f ; $\forall \epsilon > 0 \ \exists \delta > 0 : |x - x_0| < \delta \Rightarrow |f(x) - L| < \epsilon$

* meaning : as x approaches x_0, $f(x)$ approaches L

* Connection with continuity : if x_0 is in the domain, and f is continuous at x_0 $\Leftrightarrow$ $\lim_{x \to x_0} f(x) = f(x_0)$

↳ but x_0 is typically not / does not need to be in the domain of f.

* examples (how to calculate limits)

1) $\lim_{x\to 1} \frac{x-1}{x^2-1} = \lim_{x\to 1} \frac{x-1}{(x-1)(x+1)} = \lim_{x \to 1} \frac{1}{x+1} = \frac{1}{2}$

↳ it is allowed to divide numerator and denomitor by $(x-1)$, since $x \neq 1$, x only comes CLOSE to 1, but does not reach it.

2) $\lim_{x\to 2} \left(\frac{4}{x^2-4} - \frac{1}{x-2}\right) = \lim_{x \to 2} \left(\frac{4-(x+2)}{(x+2)(x-2)}\right) = \lim_{x\to 2} \frac{2-x}{(x+2)(x-2)} = \frac{-1}{4}$

* Left / Right limits : $\lim_{x \to x_0^{\mp}} f(x) = L$

↳ we approach x_0 from left$^-$ $(x < x_0)$ or right$^+$ $(x > x_0)$

* example : $\lim_{x\to 0^+} \frac{|x|}{x} = \lim_{x \to 0^+} \frac{x}{x} = 1$

$\lim_{x \to 0^-} \frac{|x|}{x} = \lim_{x\to 0^-} \frac{-x}{x} = -1$

↳ if $\lim_{x\to x_0^+} f(x) \neq \lim_{x \to x_0^-} f(x)$, then $\lim_{x \to x_0} f(x)$ DOES NOT EXIST

* this happens if $f(x)$ is discontinuous at x_0

* if left and right limit are equal, and x_0 is not in the domain of f, we can define a continuous extension of f:

→ $F(x)$ is a continuous extension of f if
$F(x) = f(x)$ for $x \in$ domain(f)
$F(x_0) = \lim_{x\to x_0} f(x_0) = L$ if $x = x_0$

* $F(x) = x+1$ is a continuous extension of $f(x) = \frac{x^2-1}{x-1}$

* examples

$$\lim_{x\to 5} \frac{|x-5|}{x^2-25}$$

- $\lim_{x\to 5^+} \frac{|x-5|}{x^2-25} = \lim_{x\to 5^+} \frac{x-5}{(x-5)(x+5)} = \frac{1}{10}$
- $\lim_{x\to 5^-} \frac{|x-5|}{x^2-25} = \lim_{x\to 5^-} \frac{5-x}{(x-5)(x+5)} = \frac{-1}{10}$

The limit does not exist!

$$\lim_{x\to 0} \frac{|x+3| - |3x-3|}{x} = \lim_{x\to 0} \frac{(\cancel{3}+x) - (\cancel{3}-3x)}{x} = 4$$

$$\lim_{x\to 0} \frac{\sqrt{1+x} - \sqrt{1-x}}{x} = \lim_{x\to 0} \frac{(1+x)-(1-x)}{x(\sqrt{1+x}+\sqrt{1-x})} =$$

$$\lim_{x\to 0} \frac{2\cancel{x}}{\cancel{x}} \frac{1}{\sqrt{1+x}+\sqrt{1-x}} = 1$$

* limits at infinity
  ↳ how does a function behave towards $\pm\infty$?

$$\lim_{x\to\pm\infty} f(x) = L \iff \forall\epsilon>0\ \exists M>0 : \begin{matrix} x>M \ (\to +\infty) \\ x<-M \ (\to -\infty) \end{matrix} \Rightarrow |f(x)-L|<\epsilon$$

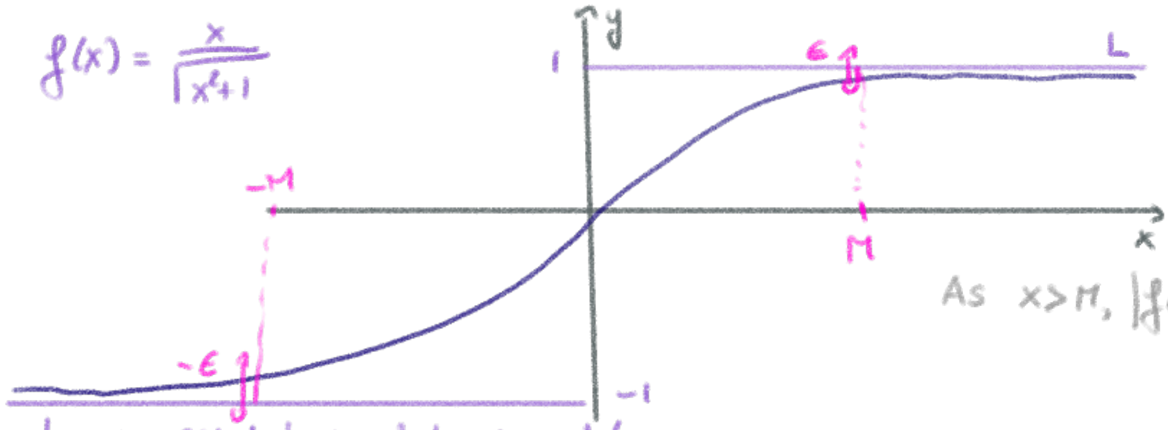
↳ IF this limit exists, the function approaches a constant value L as $x\to\pm\infty$

→ in this case, $y=L$ is a horizontal asymptote of f

Examples: $\lim_{x\to+\infty} \frac{x}{\sqrt{x^2+1}} = \lim_{x\to+\infty} \frac{x}{x\sqrt{1+\frac{1}{x^2}}} = 1$

$\lim_{x\to-\infty} \frac{x}{\sqrt{x^2+1}} = \lim_{x\to-\infty} \frac{x}{-x\sqrt{1+\frac{1}{x^2}}} = -1$

you always need to take the POSITIVE root out of the $\sqrt{\ }$ since $x\to-\infty$, $-x>0$



As $x > M$, $|f(x) - L| < \epsilon$

↳ one-sided horizontal asymptote

• other examples : $\lim\limits_{x \to \pm\infty} \frac{1}{1+x^2} = 0$

$\lim\limits_{x \to -\infty} e^x = 0$

$\lim\limits_{x \to \pm\infty} \frac{x}{x+1} = 1$

* does $\lim\limits_{x \to \pm\infty} f(x)$ always exist ? NO !!

$\lim\limits_{x \to \pm\infty} \sin(x)$ does not exist, since $f(x)$ does not approach a constant value

↳ we cannot find any large enough M, such that $f(x)$ stays within ϵ-distance of a constant L

* Infinite limits

↳ some functions become arbitrary large when approaching a finite $x_0 \in \mathbb{R}$, e.g. $\tan(x)$, $\frac{1}{x}$, $\ln(x)$

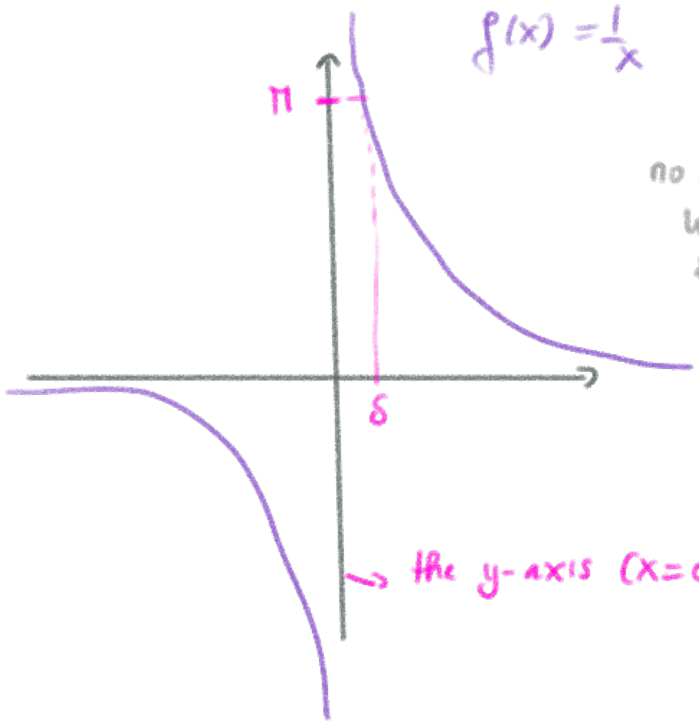
$$\lim_{x \to x_0} f(x) = \pm\infty \iff \forall M > 0 \ \exists \delta > 0 : |x - x_0| < \delta \implies \begin{array}{l} f(x) > M \ (+\infty) \\ f(x) < -M \ (-\infty) \end{array}$$

↳ in this case, $f(x)$ has a vertical asymptote $x = x_0$

* watch out : left and right limits are often different.

example : $\lim\limits_{x \to 0^+} \frac{1}{x} = +\infty$, $\lim\limits_{x \to 0^-} \frac{1}{x} = -\infty$

$\lim\limits_{x \to 0} \frac{1}{x}$ DOES NOT EXIST



no matter how large we choose $M > 0$, we can always find $\delta < \frac{1}{M}$ such that if $0 < x < \delta$, $f(x) > M$.

↳ the y-axis $(x=0)$ is a vertical asymptote

III ASYMPTOTES

Asymptote = the function approaches a straight line.

→ horizontal asymptote $(y=a)$ $\Leftrightarrow$ $\lim_{x \to \pm\infty} f(x) = a$

→ vertical asymptote $(x=b)$ $\Leftrightarrow$ $\lim_{x \to b^{\pm}} f(x) = \pm\infty$
$(b \neq \pm\infty)$

→ oblique asymptote $(y = ax+b)$ $(a \neq 0)$

$$\Leftrightarrow \lim_{x \to \pm\infty} \left(f(x) - (ax+b)\right) = 0$$

$$\Leftrightarrow \lim_{x \to \pm\infty} \frac{f(x)}{x} = a \text{ and } \lim_{x \to \pm\infty} \left(f(x) - ax\right) = b$$

↳ horizontal and oblique asymptotes can one-sided (only at $+\infty$ or only at $-\infty$) or two-sided

↳ (at one side) horizontal and oblique asymptotes exclude each other

Examples:

$f(x) = \dfrac{x^2}{x^2-1}$ has

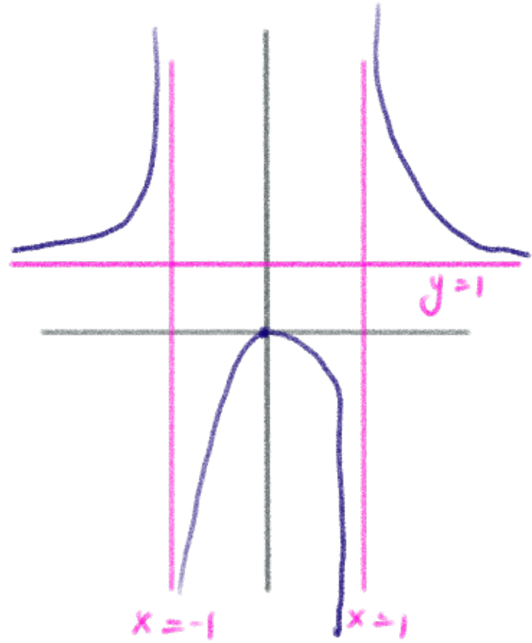
- vertical asymptotes $x=1$ and $x=-1$

$$\lim_{x\to 1^+} \frac{x^2}{x^2-1} = +\infty \quad , \quad \lim_{x\to 1^-} \frac{x^2}{x^2-1} = -\infty$$

$$\lim_{x\to -1^+} \frac{x^2}{x^2-1} = -\infty \quad , \quad \lim_{x\to -1^-} \frac{x^2}{x^2-1} = +\infty$$

- a 2-sided horizontal asymptote $y=1$

$$\lim_{x\to \pm\infty} \frac{x^2}{x^2-1} = 1$$



$f(x) = \sqrt{x^2+1}$ has

- a 1-sided oblique asymptote $y=x$

$$\begin{cases} \lim\limits_{x\to +\infty} \dfrac{\sqrt{x^2+1}}{x} = 1 = a \\ \lim\limits_{x\to +\infty} \left(\sqrt{x^2+1} - x\right) = \lim\limits_{x\to +\infty} \dfrac{\cancel{x^2}+1-\cancel{x^2}}{\sqrt{x^2+1}+x} = 0 = b \end{cases}$$

- a 1-sided oblique asymptote $y=-x$

$$\lim_{x\to -\infty} \frac{\sqrt{x^2+1}}{x} = -1 = a$$

$$\lim_{x\to -\infty} \left(\sqrt{x^2+1} + x\right) = \lim_{x\to -\infty} \frac{\cancel{x^2}+1-\cancel{x^2}}{\sqrt{x^2+1}-x} = 0 = b$$
