- Chr. yr.)

If 
$$f(x,y)dA = \int \int (4-x-y)dy dx$$

A(x)

A

we girst ealculate a cross-section along y , for fixed x : A(x)

$$\iint_{R} g(x,y) dA = \int_{0}^{2} \left( \int_{0}^{1} (4-x-y) dy \right) dx = \int_{0}^{2} \left( \frac{1}{2} - x \right) dx = \left[ \frac{1}{2} x - \frac{x^{2}}{2} \right]_{0}^{2} = \frac{1}{2} - 2 = 5$$

\* we can also take a cross-section along x

R
$$\int_{0}^{1} \int_{0}^{1} \int_{0}^{1} (x,y) dA = \int_{0}^{1} A(y) dy = \int_{0}^{1} (6-2y) dy = \left[6y - y^{2}\right]_{0}^{1} = 6-1 = 5$$

$$A(y) = \int_{0}^{1} (4-x-y) dx = \left[4x - \frac{x^{2}}{2} - xy\right]_{0}^{2} = (8-2-2y) = 6-2y$$
The outcome is a function of y

-> this is FuBiHi's theorem (the order of integration does not matter)

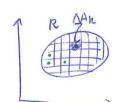

\* If f(x,y) is continuous on the rectangular region  $R: a \le x \le b$ ,  $c \le y \le d$ , then  $\iint_R f(x,y) dA = \iint_A f(x,y) dy dx = \iint_A f(x,y) dx dy$ 

$$+ \text{ Example}$$

$$\iint_{\mathcal{R}} (x+y) dA = \int_{\mathcal{R}} \int_{\mathcal{R}} (x+y) dx dy = \int_{\mathcal{R}} \left[ \frac{x^2}{2} + xy \right]_{\mathcal{R}}^{\alpha} dy = \int_{\mathcal{R}} \left( \frac{a^2}{2} + ay \right) dy = \frac{a^2 \left[ y \right]_{\mathcal{R}}^{\alpha} + a \left[ \frac{y^2}{2} \right]_{\mathcal{R}}^{\alpha} }{ = \frac{a^3}{2} + \frac{a^3}{2} = a^3 }$$

I DOUBLE INTEGRALS OVER GENERAL REGIONS

double integrals can be defined on more general regions than rectangles

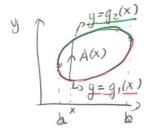

The clouble integral is the limit of the Riemann nons Sig & (x,y) dA = lim Ig(xkiyh) Ak = lim Ig(xhiyh) AAk

+ formally, we only take into account rectangles DAK that are Fully inside R: as IIPII-0, nufficiently regular oreas R

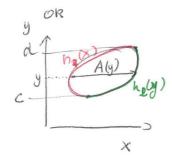

A for g(xy)>0, continuous on R, the integral Sig(xy)dA is the VOLUME between R and the surface of (x, y)

Ato ealculate this volume, we can parametrise the region R

then 
$$\iint f(x,y) dA = \iint_{\alpha} A(x) dx$$
  
 $\lim_{x \to y = g_1(x)} f(x,y) dA = \int_{\alpha} A(x) dx$   
with the eross-section  $A(x) = \iint_{\alpha} f(x,y) dy$   
 $\lim_{x \to y} f(x,y) dx$ 

then 
$$\iint f(x,y) dA = \int A(y) dy$$

Rely)

with the cross-section  $A(y) = \int f(x,y) dx$ 
 $f(x,y) dx$ 

both results are the name => stronger form of Fubini's throrem.

# If f(x,y) is continuous on a region R  $\Rightarrow f(R) = f(x,y)$  is defined as  $a \le x \le b$ ,  $g_1(x) \le y \le g_2(x)$ , with  $g_1(x), g_2(x)$ continuous on [a,b], then  $\iint_R f(x,y) dA = \iint_R f(x,y) dy dx$   $= g_1(x)$ 

-> If R is defined as  $c \leq y \leq d$ ,  $h_1(y) \leq x \leq h_2(y)$ , with  $h_1(y), h_2(y)$ continuous on  $[C_1, d]$ , then  $d h_2(y)$   $\int_{R} f(X_1y) dA = \int_{C_1} f(X_1y) dX dy$   $e h_2(y)$ 

Example

R: 
$$X: 0 \to 1$$
 $X: 0 \to 1$ 
 $X$ 

2) R: 
$$y: 0 \to 1$$
 
$$\iint_{R} y(x,y) dA = \iint_{Q} (3-x-y) dx dy = \iint_{Q} [3x - \frac{x^{2}}{2} - xy] dx$$

$$= \iint_{Q} (3-\frac{1}{2}-y) - (3y - \frac{y^{2}}{2} - y^{2}) dy = \frac{5}{2} - 2[y^{2}] + \frac{1}{2}[y^{3}]_{0}^{2}$$

\* Properties of double integrals

For f(x,y), g(x,y) continuous on R (bounded)

\* 
$$\iint_{R} (g(x,y) \pm g(x,y)) dA = \iint_{R} g(x,y) dA \pm \iint_{R} g(x,y) dA$$

R R<sub>1</sub> R<sub>2</sub>

From \* Triangle inequality | If g(x,y) dA | \le | If |g(x,y)| dA

\* integrals correspond to volumes / negative integrals to volumes helow the xy-plane

Examples

$$\int_{0}^{1} \int_{y^{2}}^{y} dx dy$$

$$\int \int x y^2 dy dx$$
