1.

36.
$$\lim_{x\to 0} \frac{|3x-1|-|3x+1|}{x} = \lim_{x\to 0} \frac{(x-3x)-(y+3x)}{x} = -6$$

Since $x \neq 0$, $|3x-1| = |-3x|$
 $|3x+1| = |+3x|$

1.3. If $\lim_{x\to 2+} \frac{x}{(2-x)^3} = -\infty$
 $\lim_{x\to 2+} \frac{1}{(2-x)^3} = +\infty$
 $\lim_{x\to 1} \frac{1}{|x-1|} = +\infty$
 $\lim_{x\to 1} \frac{1}{|x^2-2x|-x} = \lim_{x\to 1} \frac{1-\frac{2}{x}+1}{-2x} = -1$

horizontal asymptote $y = -1$ long sided

$$\lim_{x\to -\infty} \frac{1}{|x^2-2x|-x} = 0 \quad \Rightarrow \text{horizontal asymptote } y = 0$$

$$\lim_{x\to -\infty} \frac{1}{|x^2-2x|-x} = 0 \quad \Rightarrow \text{horizontal asymptote } y = 0$$

$$\lim_{x\to -\infty} \frac{1}{|x^2-2x|-x} = 0 \quad \Rightarrow \text{horizontal asymptote } y = 0$$

$$\lim_{x\to -\infty} \frac{1}{|x^2-2x|-x} = 0 \quad \Rightarrow \text{horizontal asymptote } x = 0$$

$$\lim_{x\to -\infty} \frac{1}{|x^2-2x|-x} = 0 \quad \Rightarrow \text{horizontal asymptote } x = 0$$

$$\lim_{x\to -\infty} \frac{1}{|x^2-2x|-x} = 0 \quad \Rightarrow \text{horizontal asymptote } x = 0$$

$$\lim_{x\to -\infty} \frac{1}{|x^2-2x|-x} = 0 \quad \Rightarrow \text{horizontal asymptote } x = 0$$

there are no other vertical asymptotes, since.

1.4 1-2 -2: continuous 1 right continuous (this is the pame for an end point)

-1: discontinuous, removable discontinuity

g l-i) = 1. Would make the function continuous

0: left continuous (discontinuous)

1 : right continuous (discontinuous)

2: removable discontinuity.
gle) = 0 would make the function continuous

17. $f(x) = \int_{-\infty}^{\infty} x^{2} \times 4 = 2$ $(k \times x^{2} \times x) = 2$

 $f(2) = 4 = lim (k-x^2) = k-4 = > k = 8$
